

- Read all handouts
- Create a file named "Japan" as a regular user in your home directory
- Change permissions to only allow yourself to read it
- Change permission to allow other to read as well now
- Become root and change the ownership of the file Japan to root
- Change the group ownership for Japan file to root as well
- Become yourself as a user now
- Move the Japan file from your home directory to /tmp directory
- Are you able to move that file? If yes then what is the reason? You should have figured that out by now
- Now cd into /tmp directory and delete the Japan file. Are you able to delete it and if not why? Again you should know the answer
- Become root and now using ACL assign yourself the read and write permission for Japan file in /tmp directory
- Verify the ACL permissions
- Try to write to that file Japan
- Try to delete that file
- Practice a few more times with different users and different files
